BUSINESS ANALYST PORTFOLIO

Olist E-Commerce Operations Analysis | SQL + Advanced Excel | 2026

PROJECT OVERVIEW

A real SQL + Excel case study using e-commerce order, review and payment data to move from business questions to analysis, insight and action.

Dataset scale: 100k+ records | **Revenue analysed:** R\$16M | **Analyses:** 4 | **States compared:** 27

THE BUSINESS QUESTIONS

1. Why are some orders taking so long to resolve?
2. Which regions need logistics investment first?
3. Which product categories are underperforming with customers?
4. Where does the business actually make its revenue?

INSIGHT 01 — DELIVERY TIME

Finding: Cancelled orders took 62% longer to resolve than delivered orders. Average delivery time shown in the project: 12.5 days for delivered orders vs 20.3 days for cancelled orders.

Why it matters: Investigate cancellation timing, fulfilment delays and customer-service touchpoints before cancellation happens.

SQL approach: GROUP BY order status with AVG and DATEDIFF.

INSIGHT 02 — REGIONAL DELAYS

Finding: Five states — RR, AP, AM, AL and PA — were identified as the clearest starting points for logistics review, based on average delivery delay.

Why it matters: Review carrier coverage, route design and fulfilment locations.

SQL approach: JOIN orders to customers, GROUP BY state and ORDER BY average delivery days descending.

INSIGHT 03 — PRODUCT EXPERIENCE

Finding: Fashion and audio categories showed the highest share of reviews scoring 2 or below; fashion was 22.9% in the project analysis.

Why it matters: These categories warrant deeper checks on product quality, seller performance, listing accuracy and expectation-setting.

SQL approach: Conditional counting of low scores, category aggregation, minimum review-volume filter and ranking.

INSIGHT 04 — REVENUE MIX

Finding: Credit card payments generated 78% of total revenue in the project.

Why it matters: Payment reliability and checkout conversion deserve ongoing monitoring because revenue is concentrated in one channel.

SQL approach: SUM payment value, GROUP BY payment type and ORDER BY revenue descending.

BUSINESS RECOMMENDATIONS

- Start logistics review with high-delay states and cancellation journeys.
- Investigate product quality, seller performance and listing accuracy in categories with high low-rating shares.
- Monitor payment reliability and adoption in the dominant credit-card channel.
- Extend the analysis with seller-level and time-based views to build a more targeted action plan.

SKILLS DEMONSTRATED

Business framing • SQL joins • Aggregation • Filtering • Conditional logic • Excel visualisation • Insight-to-action recommendations • Stakeholder-ready reporting

TOOLS

SQL (MySQL) • Microsoft Excel • PowerPoint
